INSTAKEY

KeyControl for your Supply Chain

Security. Efficiency. Cost-Savings.

InstaKey® Security Systems is the manufacturer of a comprehensive, managed key control program. This program is not just a key system. This program addresses the keyed access needs of the supply chain and reduces the costs and liabilities normally associated with conventional mechanical key systems.

Many factors arise when considering the best security solution for your supply chain facilities. First and foremost, will always be the safety and security of your personnel and products. Unfortunately, numerous aspects can contribute to security breaches or safety concerns at your facilities, against your employees, as well as targeting your products, or more importantly, profits.

Take a moment to ask yourself…

- Are you controlling which personnel have access to which access points?
- When a key is lost or stolen, are you preventing that key from being used to enter or access your facilities without your permission or knowledge?
- When an employee is terminated and fails or refuses to return their key, do you promptly rekey the facility to prevent unauthorized use?
- Does personnel have to have several keys on them at all times to gain access to different areas of your facilities?
- Are you locking up trucks with high security padlocks to prevent theft?
- When a Master Key is lost, how expensive is it to replace all of the locks associated with that key?
- Are you waiting for replacement cores or a locksmith to rekey each time a key is lost?
- When a security breach occurs, is there tracking information available that helps your investigation of knowing who had access?
- Do you have a single point of contact or supplier managing your lock and key needs that can respond promptly?

No matter how you answered these questions, there is probably some opportunity to make changes to your key control program in order to enhance security, efficiencies, and/or reduce costs.

Most people don't make keyed security needs a high priority until there is a security breach. By not addressing these needs proactively, emergency rekey costs can be high, but it is the safety concerns that can result in much larger unforeseen loss from liabilities and shrink. A KeyControl program from InstaKey can help. Here's how:

Control Access

InstaKey KeyControl programs feature restricted keys. These keys cannot be duplicated, and new keys cannot be made without authorization. Key blanks are needed in order to duplicate keys. Restricted key blanks are not available on the open market, making it impossible to duplicate a key. With key restriction, issued keys remain the only keys in circulation. When restricted keys are returned by transitioning key holders, those keys can

be reassigned to new key holders without the risk of a security breach and without the need to spend on rekeying locks.

Keep Track of Access

If keys are being transitioned between key holders as employee turnover occurs, keeping track of who has access to what becomes important. When a security breach occurs, you'll want to have this information readily available to aid in the investigation. InstaKey's cloud-based key tracking software, SecurityRecords. com® streamlines the process of tracking keys like paper files and standalone software can't. Audit key holders, issue keys digitally, survey sites, keep track of costs, get program performance reporting and so much more!

Immediate, Cost-Effective Rekeys

Traditional rekeying methods are expensive and slow, leaving people and products vulnerable during the wait. InstaKey's user-rekeyable locks have revolutionized key system management to provide immediate rekeys with the turn of a key – and these rekeys come at a fraction of the cost of a locksmith callout or core swap. With InstaKey, the cost of a rekey is equivalent to the cost of a new set of keys, even for a master key system. Cost can be a barrier to rekeying every time it's needed – but not with InstaKey.

Rekeying Kits Include:

1. Sealed, tamper-proof bag
2. Lubricating dry graphite
3. Door list and indicator for each Step
4. Rekeying Instructions
5. New keys to assign
6. Step Change Key

Adhesive storage pouch provided for in-safe storage

Program Partnership

Other lock and key manufactures are in the business of selling you more brass. Our goal is the opposite. We'd like to sell you as little brass as possible. In order to do that, tight program control is necessary. The most secure, cost-effective key control programs are those that are managed proactively. That is exactly what InstaKey does in partnership with our clients. We're bringing all the expertise in hardware, key tracking software and best practices that 30+ years of experience can offer – and we become an extension of your team, as a single point of contact. We'll be here every step of the way to control costs and help manage your key system as if it were our own.
